

# PESA ACES™ Multicam capture/review for Educators

Education goes way beyond the classroom. Helps students and educators capture, collaborate and share, no matter where they are located.

The bundled hardware and software solutions, known as PESA ACES, offers robust audio and video capture and management features. PESA's XSTREAM multi-channel hardware solutions capture multiple streams of audio and video from a wide range of devices and formats and offer accurate time synchronization of voice and video elements. Flexible software controls the capture from a simple, user-friendly graphic user interface, and adds sophisticated features like multi-tiered secure file synchronization to redundant storage servers in real-time, indexed multimedia attachments and notes, advanced search functionality and powerful audit and analytics reporting.

## Easily capture and share important lessons

Create high-quality audio-video recordings of your class or presentation for students to review on their own schedule. You can add integrated text information, such as links to additional reading, or even add attachments like assignments or presentations. A secure portal allows remote viewers access to the files.

## Private and Secure

Granular management controls let administrators assign access to specific recordings and files on a user-by-user basis, meaning only authorized students, TAs or professors can access materials. Integrated data analytics let you monitor and review all activity on the system: when a user logged in, what material they accessed, what device they used and where they logged in from.

## Add other classroom tools, like presentations or assignments

Digital content like photos, videos, presentations, assignments, and more can be added to the recorded lesson or presentation. If it's a file that can be opened on a computer, you can attach it. These "multimedia" attachments receive the same secure, tamper-proof treatment as the recorded audio and video files, ensuring that they are a complete, secure file.

## Quick search capabilities

The database infrastructure ensures that you can search on a wide range of recording information, such as date/time, professor name, etc., in order to easily locate your files. You can even search on partial matches, so as long as you remember anything at all about the recording, you'll be able to find it.
